

Question 1

Let's assume the probability of rolling three (3), two times in a row of a uniform dice is p . Consider a sentence consisting of N random digits. A model assigns probability to each of the digit with the probability p . Find the perplexity of the sentence.

1. 10
2. 6
3. 36
4. 3

Answer: 3) 36

Question 2

Which of the following is false?

1. Derivational morphology creates new words by changing part-of-speech
2. Inflectional morphology creates new forms of the same word
3. Reduplication is not a morphological process
4. Suppletion is a morphological process

Answer: 3)

Question 3

Assume that "x" represents the input and "y" represents the tag/label. Which of the following mappings are correct?

1. Generative Models - learn Joint Probability $p(x, y)$
2. Discriminative Models - learn Joint Probability $p(x, y)$
3. Generative Models - learn Posterior Probability $p(y | x)$ directly
4. Discriminative Models - learn Posterior Probability $p(y | x)$ directly

Answer: 1) and 4)

Question 4

Which one of the following is an example of the discriminative model?

1. Naive Bayes
2. Bayesian Networks
3. Hidden Markov models
4. Logistic Regression

Answer: 4) Logistic Regression

Question 5

Natural language processing is essentially the study of the meaning of the words a human says or writes. Natural language processing is all around us all the time, but it also happens to be a way to improve the chatbot or product we interact with on a regular basis. Natural language processing is all about mimicking our own language patterns. Natural language processing can also improve the efficiency of business transactions and customer care. Natural language processing is the application of computer technology.

Suppose we want to check the probabilities of the *final words* that succeed the *string* language processing in the above paragraph. Assume $d = 0$; it is also given that no of unigrams = 78, no of bigrams = 122, no of trigrams = 130,, Question 6 and Question 7 are related to Question 5 corpus.

Solve the question with the help of **Kneser-Ney backoff technique**.

What is the continuation probability of "is" ?

1. 0.0078
2. 0.0076
3. 0.0307
4. 0.0081

Answer 2) 0.0076

Question 6

What will be the value of $P(\text{is} | \text{language processing})$ using Kneser-Ney backoff technique and choose the correct answer below. . Please follow the paragraph in Question .

1. 0.5
2. 0.6
3. 0.8
4. 0.7

Answer 3) 0.8

Question 7

What is the value of $P(\text{can} | \text{language processing})$? Please follow the paragraph in Question 5

1. 0.1
2. 0.02
3. 0.3
4. 0.2

Answer 4) 0.2

Question 8

Which of the following morphological process is true for motor+hotel → motel?

1. Suppletion
2. Compounding
3. Blending
4. Clipping

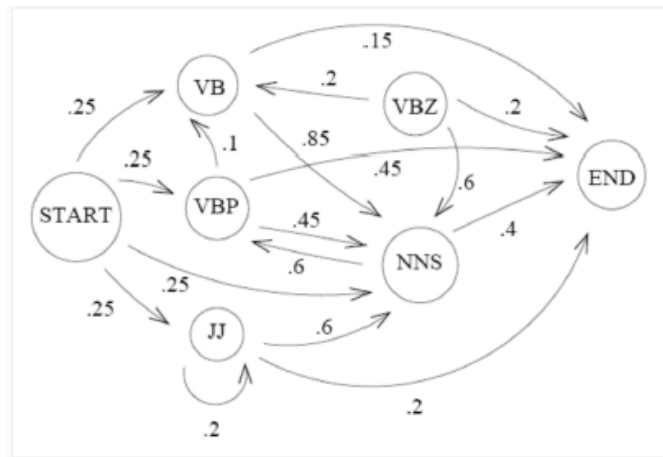

Answer 3) Blending

Question 9

Consider the HMM given below to solve the sequence labeling problem of POS tagging. With that HMM, calculate the probability that the sequence of words “free workers” will be assigned the following parts of speech;

VB NNS

	<i>free</i>	<i>workers</i>
JJ	0.00158	0
NNS	0	0.000475

VB	0.0012	0
VBP	0.00081	0
VBZ	0	0.00005

The above table contains emission probability and the figure contains transition probability

1. $4.95 * 10^{-8}$
2. $9.80 * 10^{-8}$
3. $4.84 * 10^{-8}$
4. $3.94 * 10^{-7}$

Answer 3) $4.84 * 10^{-8}$

$$\begin{aligned}
& P(\text{free workers, VB NNS}) \\
&= P(\text{VB}|\text{start}) * P(\text{free}|\text{VB}) * P(\text{NNS}|\text{VB}) * P(\text{workers}|\text{NNS}) \\
&\quad * P(\text{end}|\text{NNS}) \\
&= 0.25 * 0.0012 * 0.85 * 0.000475 * 0.4 \\
&= 4.84 * 10^{-8}
\end{aligned}$$

Question 10

Which of the following is/are true?

1. Only a few non-deterministic automata can be transformed into a deterministic one
2. Recognizing problem can be solved in quadratic time in worst case
3. Deterministic FSA might contain empty (ϵ) transition
4. There exist an algorithm to transform each automaton into a unique equivalent automaton with the least no of states

Answer: 2) and 4)
